

SLACS: Spatially-resolved Laser Activated Cell Sorting

The Future of Spatial Omics Analysis

SLACS | Spatially-resolved Laser Activated Cell Sorting

The SLACS (Spatially-resolved Laser Activated Cell Sorting) system is a revolutionary technology developed by Meteor Biotech. Powered by a decade of industry-leading research and experience, SLACS enables precise isolation of cells from pathological tissue for molecular assays. The brilliance of SLACS lies in its use of an infrared pulse laser, offering unparalleled speed and precision. With a resolution of 1 μm to 1 mm, SLACS can isolate targets at an impressive speed—up to one target per second. This swift operation doesn't compromise on sample quality, with the system ensuring the preservation of cellular integrity during the process. Our technology bridges the gap between tissue microscopy and molecular assay, providing a high-resolution spatial context that other sequencing technologies lack.

SLACS PERFORMANCE | Speed, Precision, Versatility, and Advanced Spatial Analysis Unveiled

Ultra-fast Operation:

SLACS excels in delivering results rapidly without compromising on precision or accuracy. It can isolate cells at an astonishing pace of one target per second.

Spatial molecular analysis:

SLACS does more than just isolate cells swiftly and precisely. The true power of SLACS comes from its ability to open up an entirely new world of spatial molecular analysis. By isolating cells from specific spatial coordinates within pathological tissue samples, SLACS enables subsequent molecular assays to be performed with a clear spatial reference.

This powerful feature expands the boundaries of your research, allowing you to carry out any molecular analysis that can be performed in PCR tube-based assays, but with the added dimension of spatial context.

The transformative effect brought by SLACS is not just about speed—it's about delivering precision without compromise. See for yourself how SLACS maintains cellular integrity, bridges the gap between tissue microscopy and molecular assay, and provides a high-resolution spatial context that other technologies lack.

With SLACS, you can unlock new levels of understanding in pathological research.
